

## Information Management System

**VBM.** An advanced enterprise grade information management system, helps you gain control of and share the information and 'know-how' constantly being created around you. VBM provides the tools and technologies enabling you to manage your electronic filing and bring security and visibility to your intellectual property.

## Visualize Your Business with VBM

Welcome to the ultimate visual business information and data management system for use in small to large business or projects, featuring the powerful Relational File System.

Your computer's operating system, while providing unbridled flexibility, does so at the expense of workable business management systems. You want to properly manage your business or project information. You want to stop people creating files, assigning random names, filing in any location, without you

being in control. You want to stop the proliferation of directories and files which invariably results in hard to find information, unproductive recovery time and even lost intellectual property. In workgroup situations these costs have become significant and an expense to your business.

VBM offers you a set of innovative tools to help you manage your electronic files and allows your business or project to have the fullest attention of its most important person - You.

### What is VBM ?

VBM is a clever software application which runs on either a single Windows® computer or over a network. VBM provides you with a suite of practical tools and systems to manage the visibility and controlled access to your underlying business or project information.

Unlike other software applications which dictate how you should run your business or project, VBM can be configured to replicate your current business and project systems. It can be changed to grow and develop as your business evolves and your systems and business model matures. You upgrade your VBM license when you decide, to complement the growth of your business or project.

### Why is VBM Unique?

VBM contains the Relational File System, a unique file management tool which operates between the standard Windows® file system and most applications running on your computer. RealFS transforms your standard Windows® file system into a relational file system which is able to capture the relationships which exist between your files – their context and your intellectual property.

RealFS supports the power of your existing computer applications while providing a single simple user interface to access most 3rd party applications.

# Key Features

VBM turns your flat, uncontrolled Microsoft® Windows file system into a multi-dimensional relational file system by covering it with a unique set of layers. These layers control both the underlying files and your team's access to them. VBM does not replace any of your computer applications but compliments their power by giving you a single user interface to manage the files they create. VBM provides a secure and consistent method of managing and accessing files from a large number of 3rd party applications.

RealFS operates between your standard Microsoft® Windows file system and most 3rd party software applications running on your computer. RealFS transforms the Windows file system from its uncontrolled flat file structure into a secure multi-dimensional relational file system.

MyComm Messenger provides you with innovative tools for file distribution and communication within a team environment. MyComm Messenger with Microsoft® Outlook integration supports the RealFS as a document distribution, notification and reminder system.

\* Migration to SQL Server (or MSDE) is recommended for Enterprise Multi-User license
